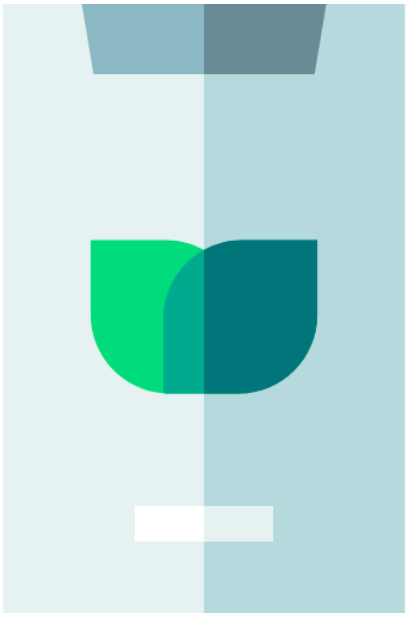
Complete Documentation of Audition Application



- Requirements
- Design
- Development
- Test
- Deployment

Requirement Analysis

An application to serve REST API calls to be dockerized and deployed on cloud.
Requirement 1: Users

1. An Onboarding Admin User
2. Regular User who can register via admin user action

Requirement 2: Database

1. MongoDB for Application
2. Collection for Users and Password
3. Collection for Comments

Requirement 3: Content

1. User Name as unique string in User Collection
2. Password stored as hash in User Collection
3. Comments as string values to be stored in Comment Collection
4. Comment ID as unique string to be stored in Comment Collection
5. User Name as string to refer to User Collection

Requirement 4 : Action

1. Submit Comment differentiated by Comment ID by User Name
2. Delete Comment differentiated by Comment ID by User Name
3. View all comments from Database
4. Check Comment for Palindrome feature differentiated by Comment ID by User Name

Requirement 5: UI

1. UI for Login
2. UI for Register
3. UI for Dashboard
4. UI table on Dashboard to view comments and initiate delete and check palindrome actions
5. UI text area to submit new comments

Requirement 6: Containerization

1. Docker file for creating Docker Image
2. Docker Image for the application
3. Uploaded Docker image on Docker Hub
4. Docker Compose file for Execution

Requirement 7: Deployment

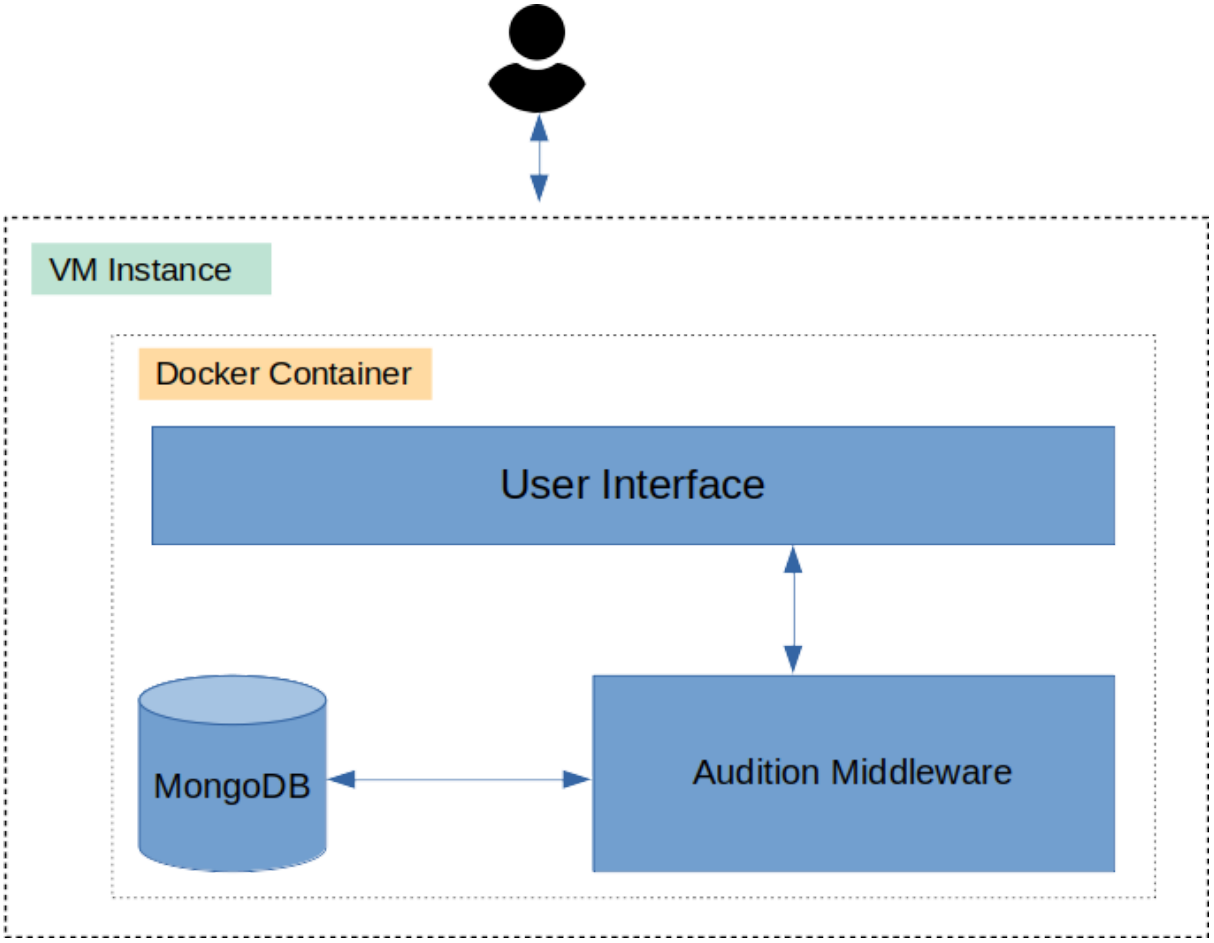
1. VM creation
2. Firewall Configuration
3. Volume Configuration
4. Cloud Native Deployment of Application

Requirement 8 : Monitoring

1. Build capability to (Monitoring/Traceability/metrics)

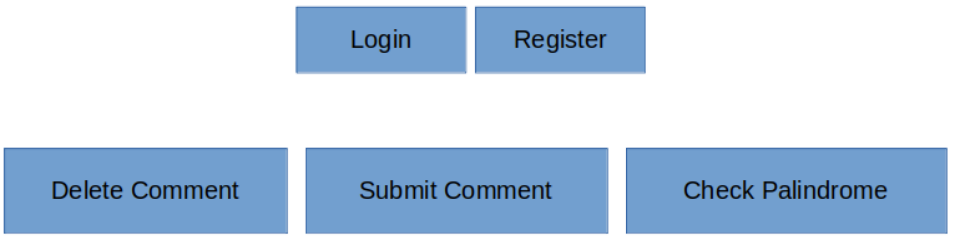
Designing the Product Architecture

A simple design of the product architecture.



Technology Used :

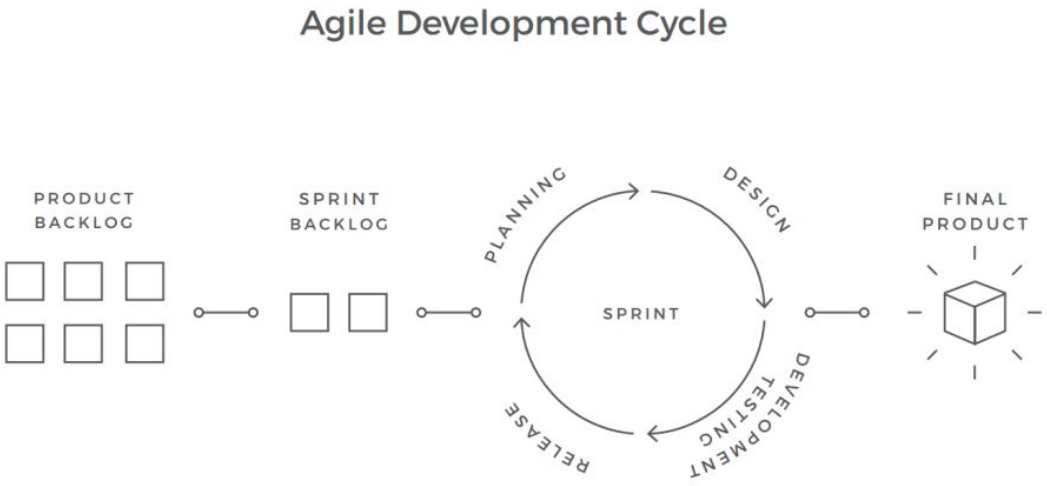
1. MongoDB
2. Golang
3. HTML CSS
4. Javascript
5. Docker
6. Docker-Compose



Functionality Map

Building or Developing the Product

Actual development process follows agile methodology for quick completion and observance.The golang/html code is generated as per design during this stage.



Product Backlog :

1. Create Golang Server
2. Create HTML pages for Login,Register & Dashboard
3. Creation DB and Collections
4. Creation User & Comment Structure
5. Creation DB Handling Methods
6. Creation HTML Template Parse Methods
7. Creation RestAPI Response Method
8. Creation of Handlers for 3 Pages
9. Creation of Handlers for Ajax calls Submit,Delete and Check
10. Completion of Application Storage and REST

Project Backlog can be traced here : https://github.com/users/elkarto91/projects/2

Testing the Product

Evaluate by comparison to the set of requirements.

Deployment in the Market and Maintenance

The application will be deployed as per requirements as mentioned below.

Deployment Steps :

1. Creation of Docker File
2. Creation of Image
3. Upload to Docker Hub Store
4. Creation of Docker Compose File
5. Creation of VM
6. Firewall Rule Change
7. Execution of Application
